Complete Summary

TITLE

Hypertension: percentage of patient visits with blood pressure measurement recorded.

SOURCE(S)

Process

The validity of measures depends on how they are built. By examining the key building blocks of a measure, you can assess its validity for your purpose. For more information, visit the Measure Validity page.

SECONDARY MEASURE DOMAIN

Does not apply to this measure

Brief Abstract

DESCRIPTION

This measure is used to assess the percentage of patient visits with blood pressure measurement recorded among all patient visits for patients aged greater than or equal to 18 years with diagnosed hypertension.

RATIONALE

According to National Heart, Lung, and Blood Institute (NHLBI), Institute for Clinical Systems Improvement (ICSI), and Department of Veterans Affairs (US) guidelines, obtaining proper blood pressure (BP) measurements at each health care encounter is recommended for hypertension detection. Repeated BP measurements (greater than or equal to 2 per patient visit) will determine if initial elevations persist and require prompt attention.

According to National Heart, Lung, and Blood Institute (NHLBI) guideline, classification of adult BP (including stages 1 to 3 of hypertension) is useful for making treatment decisions and is based on the average of greater than or equal to 2 readings taken at each of 2 or more visits after an initial screening.

According to National Heart, Lung, and Blood Institute (NHLBI) guideline, hypertension is defined as systolic BP of 140 mm Hg or greater, diastolic BP of 90 mm Hg or greater, or taking antihypertensive medication.

PRIMARY CLINICAL COMPONENT

Hypertension; blood pressure measurement

DENOMINATOR DESCRIPTION

All patient visits for patients aged greater than or equal to 18 years with diagnosed hypertension

NUMERATOR DESCRIPTION

Patient visits with blood pressure measurement recorded

Evidence Supporting the Measure

EVIDENCE SUPPORTING THE CRITERION OF QUALITY

- A clinical practice guideline or other peer-reviewed synthesis of the clinical evidence
- One or more research studies published in a National Library of Medicine (NLM) indexed, peer-reviewed journal

NATIONAL GUIDELINE CLEARINGHOUSE LINK

- Primary prevention of hypertension. Clinical and public health advisory from the National High Blood Pressure Education Program.

Evidence Supporting Need for the Measure

NEED FOR THE MEASURE

Variation in quality for the performance measured

TARGET POPULATION AGE

Age greater than or equal to 18 years

TARGET POPULATION GENDER

Either male or female

STRATIFICATION BY VULNERABLE POPULATIONS

Unspecified

Characteristics of the Primary Clinical Component

INCIDENCE/PREVALENCE

Fifty million, or approximately 1 in 5 Americans (1 in 4 adults), have hypertension.

Despite potential risks and established clinical guidelines, recent data suggest that some patients are not being managed optimally for this disease. It has been reported that:

- Approximately 15% of individuals who are aware that they have hypertension are not receiving therapy, and about 26% are receiving inadequate therapy and treatment.
- In 2001, only 55% of individuals aged 46-85 years in Health Plan Employer Data & Information Set (HEDIS®) participating managed care plans had their hypertension adequately controlled.
- In 2000, only 47% of Medicare beneficiaries had their hypertension adequately controlled.

EVIDENCE FOR INCIDENCE/PREVALENCE

American Heart Association. Heart disease and stroke statistics - 2003 update. Dallas (TX): American Heart Association; 2002. 46 p.

Oliveria SA, Lapuerta P, McCarthy BD, L'Italien GJ, Berlowitz DR, Asch SM. Physician-related barriers to the effective management of uncontrolled hypertension. Arch Intern Med2002 Feb 25;162(4):413-20. PubMed

ASSOCIATION WITH VULNERABLE POPULATIONS

Unspecified

BURDEN OF ILLNESS

Hypertension, the most treatable form of cardiovascular disease, has been identified as a major risk factor for coronary heart disease, the leading cause of death in the United States. Untreated hypertension can also result in stroke, kidney failure, and blindness. Nearly one-third of adults with hypertension are unaware of it, which therefore increases the risk of associated complications and diseases.

From 1989 to 1999, the mortality rate from hypertension increased 21%.

EVIDENCE FOR BURDEN OF ILLNESS

American Heart Association. Heart disease and stroke statistics - 2003 update. Dallas (TX): American Heart Association; 2002. 46 p.

UTILIZATION

Unspecified

COSTS

The total direct and indirect costs of hypertension in the United States are estimated at more than $50 billion annually.
